

List of List

This feature, a key component of the Environmental Reporting and EHS Management Suites, allows users to develop and maintain regulatory lists from any source. The chemical lists are used by FacTS™ to generate agency reports such as Form R or CERCLA. Standard reports can also be run to compare product/usage/inventory records against the listed substances and associated reportable quantities. A number of US Federal Environmental Lists are provided standard with List of List, and updated yearly with the FacTS maintenance plan.

LIST CREATION

The List of Lists function provides the ability to create and maintain an unlimited number of International, Federal, State, Local, internal, and custom regulatory lists from any source. It associates data (including issuing agency, regulated substance, and reportable quantity) to each list. Effective Dates and comments about the list can also be stored.

CAS Numbers are linked to a list. Information about each chemical, unique to that list, can be stored, such as de minimis, threshold quantity and unit, threshold planning quantity, etc. Default list types include:

- 302
- 313
- CERCLA
- TSCA
- Category
- Limit
- User Defined

Categories of chemicals such as Lead or Antimony can also be linked to a list, as well as linking Product IDs to them.

Multiple versions of lists can be stored to re-run reports for different years to either resubmit or do comparisons of report results from year to year.

STANDARD REPORTS

List of List comes with several standard reports. Users can cross-reference any list against the MSDSs in the FacTS database to obtain a listing of materials that contain potentially reportable chemicals. You can identify all lists that a chemical is on. Three reports are helpful when using FacTS to track chemical inventory. Yearly Usage by List and Inventory Usage by List cross-references any list against yearly product usage or product inventory for a specified time frame. Maximum Storage report shows the maximum levels of EHS chemicals for a specified year. This report is particularly useful when preparing the Tier II report.

OTHER FEATURES

List of Lists are used by **MSDS Authoring** to determine if a product has a chemical on a list that needs to be listed in Section 15.

List of List also includes a List Export Utility and List Import Utility. The Export Utility allows users to export a list to use in other applications, or easily edit as a text file and re-import as another version. The Import Utility allows users to quickly load electronic lists in the import format.

Through a partnership with DHI Group, (<http://www.dhigroup.com>), customers can purchase European and Asian/Pacific regulatory lists that can be imported into FacTS.

If customers already have a regulatory list subscription through another company, Quantum can load those updates for a yearly service fee.
